The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises motion at least one or more nucleic acids to at least two or more nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring corresponds are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms. CC of family members of a gene and a cross species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific acid probes is useful in in situ hybridisation, in Southern, Northern or dotter attached and previously sequenced. The sequence or specific mutations of any gene, in mapping the 5' termini of mRNA molecules by compared and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence of the moles of this patent can also be obtained in electronic format directly from USPTO at sequence. Itml

Human MEXK5; mitogen-activated protein kinase kinase kinase 5; MEX kinase 5; MAP/BEK kinase 5; ASK1; pro-apoptotic; apoptosis signal-regulating kinase 1; programmed cell death; serine/threonine kinase; MAP kinase cascade; JNK/SAPK module; Jun N-terminal kinase/stress-activated protein kinase; p38 module; SEK1; transcription factor modulation; expression inhibition; antisense; Human MEKK5 phosphorothioate antisense oligonucleotide, SEQ ID NO:34. (first entry) 20-NOV-2000

```
Sequences AAA61956-A61995 represent phosphorothioate antisense
cligonucleotides targetted to the human MEKK5 gene, which inhibit its
cligonucleotides targetted to the human MEKK5 gene, which inhibit its
cappression. The antisense oligonucleotides were designed to target
different regions of the human MEKK5 RNA, and were analysed for their
clifferent regions of the human MEKK5 RNA, and were analysed for their
effect on MEKK5 mRNA levels by quantitative real-time PCR. MEKK5 (also
controlled the member of transcription factors.

CC frown as MEKK5 is thought to play a critical role in the completion of apoptosis (programmed cell death) by interacting with other or cregulation of apoptosis (programmed cell death) by interacting with other controlling cascade and by phosphory-lating downstream targets such as MEKK3 and SEK1. MEKK5 also participates in another apoptosis-related as MIKK3 and SEK1. MEKK5 also participates in another apoptosis-related as MIKK3 and dimerisation of MEKK5 is induced by tumour necrosis factor—alpha (TNP-alpha), these processes being mediated by reactive oxygen captivation and dimerisation of MEKK5 is induced by reactive oxygen species. Thioredoxin is able to associate with MEKK5 and inhibit MEKK5 changes activity and hence MEKK5-dependent apoptosis. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associate with MEKK5 expression, such as inflammation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense compounds useful for treating or preventing infection, inflammation or tumor formation by inhibiting expression of human MEKKS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Acid-resistant microorganism; detection; faecal; intestine; infection; monoclonal antibody; light chain; complementarity determining region; CDR; beta-urease; ss.

This invention describes a novel method for the detection of a mammalian infection by an acid-resistant microorganism (A) by treating a faecal sample with at least two different monoclonal antibodies (MAD) for their fragments or derivatives) or aptamers (collectively (I)) and detecting formation of a complex (C) between (I) and the corresponding antigen of formation of a complex (C) between (I) and the corresponding antigen of (A). These epitopes are present, after passage through the intestines, in at least some mammals, and have either: (i) their native structure: or in at least some mammals, and have either: (i) their native structure: or infercted or immunized with (A), or its extract, lysate, derived protein or fragment, or with a synthetic peptide. Practically all mammals display or leacted or inferction by acid-fast bacteria, particularly of the genera Helicobacter, Mycobacterium and Campylobacter; specifically H. pylori, H. hepaticus, M. therapeutically. The method is direct and non-invasive, and provides an inexpensive and easily standardizable diagnosis, despite possible degradation of antigens during passage through the intestines. This sequence encodes a fragment of a H. pylori beta-urease-binding antibody illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                         Detecting infection by acid-fast microbes for diagnosis of Helicobacter pylori, comprises reacting a fecal sample with two binding reagents for antigens that survive intestinal passage.
                                                                                                                                                                                                                       Lakner M;

This invention describes a novel method for detecting, in a mammal, infection by an acid-resistant microorganism (A) which comprises reacting a fecal sample with: (i) a receptor (R) such that a complex is formed with: (i) a receptor (R) such that a complex is formed with Ag, and the formation of a complex detected. R are complex is formed with Ag, and the formation of a complex detected. R are specific for an Ag which, after passage through the intestines, at least in some mammals, retains a native (or corresponding) structure against which the mammal produces antibodies (when immunized or infected with (A), or its extracts, lysates or derived proteins (or fragments) or synthetic peptides). The products of the invention have antibacterial activity. The method is used to diagnose infection by Helicobacter, Campylobacter or Mycobacterium, particularly H, pylori (most preferred), H, hepatica, C. jejuni and M. tuberculosis, and also to monitor the progress of treatment. Receptors, particularly antibodies, directed capanist Ag can be used therapeutically for treatment of infections. The method requires only one R to provide a reasonably secure diagnosis (although use of two R improves sensitivity), so is relatively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Geranylgeranyl diphosphate synthase; GGPP synthase; yew; cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel method for detecting infection by an acid-resistant microorganism (A), in a mammal, using infection by an acid-resistant microorganism (A), in a mammal, using infection by an acid-resistant microorganism (A) in a mammal, such as Helicobacter, Campylobacter or Mycobacterium, particularly H. pylori (most preferred), H. hepatica, C. jejuni and M. tuberculosis. The method is rapid, simple, inexpensive and non-invasive, and may indicate the stage of infection. A present in the method may include a filter to eliminate particles secure diagnosis, with specificity and selectivity improved by detecting several epitopes (of catalase) or different antigens (catalase) or different antigens (catalase and betaurease). The method can be automated. This sequence encodes a
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting infections by acid-resistant microorganisms, particularly for diagnosing Helicobacter pylori, comprises immunochromatographic detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Heavy chain; light chain; catalase; beta-urease; detection; CDR; antigen; infection; acid-resistant microorganism; fecal; antibody; diagnosis; antibacterial; complementarity determining region; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      complementarity determining region (CDR) from an antibody raised against the H. pylori catalase or beta-urease antigen which is used to illustrate the method of the invention

The present sequence represents a PCR primer for a geranylgeranyl diphosphate (GGPP) synthase protein. GGPP synthase has cytostatic activity. A vector encoding GGPP synthase is useful in increasing GGPP synthase levels in a host cell preferably Taxus (Yew) cell and thereby facilitates production, isolation and purification of larger amounts of GGPP synthase in plants. GGPP synthase is useful in obtaining expression or enhanced expression of GGPP and other diterpenes, such as paclitaxel, useful as anticancer drugs. Isolated nucleic acids encoding GGPP synthase or hybridising with GGPP synthase encoding nucleic acids are used for identifying genes encoding GGPP synthase from microorganisms such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polypeptide-HOMO DNA-dependent 2-hydroxy acid dehydrogenase family protein 26.29 and encoding polynucleotide, used in diagnosis and treatment of e.g. malignant tumors, hemopathy, immunological diseases and
                                                                                                                                                                                                                                                                                                                                     Nucleic acid encoding geranylgeranyl diphosphate is useful for producing paclitaxel and other diterpenes that are useful as anticancer drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; DNA dependent 2-hydroxy acid dehydrogenase protein; enzyme;

The invention relates to HOMO DNA-dependent 2-hydroxy acid dehydrogenase family protein 26.29 with cytostatic, virucidal, immunomodulatory, antinflammatory and haemostatic activity. The protein and encoding polynucleotide are used in diagnosis and treatment of malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The polynucleotide is useful in gene therapy. The present sequence is that of a HOMO DNA-dependent 2-hydroxy acid dehydrogenase family protein 26.29 PCR primer, useful in examples of
                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for producing 1,3-propanediol from a carbon source, comprising culturing a recombinant microorganism having glycerol dehydratase and/or 1,3-propanediol dehydrogenase from Clostridium butyricum (see AAB73300, AAB80887 and AAB80889). The method of the present invention is useful for the production of 1,3-propanediol, which is useful as a stabiliser for lipases, amylases and proteases in wash liquids, as a protective emollient in liquid detergents for hand and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Production of 1,3-propanediol comprises culturing a recombinant microorganism expressing coenzyme B12-independent glycerol dehydratase.
                                                                                                                                                                                                                                                                                          Gaps

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in manitoring gene expression levels by hybridisation to a DNA library, or an analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises completed acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring care expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid substitution to identify or detect the sequence or specific blot hybridisation to identify or detect the sequence or specific mattations of any gene, in mapping the 5' termin of mRNA molecules by the analysis or subclones
                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at seqdata.uspto.goc/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Suggiments Analysis represent numbers which could be already and suggiments and suggiments and suggiments. The biallelic polymorphic markers. The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in a method for determining polymorphic forms in an individual. The invention further provides computer-readable storage medium for storing data for access by an application programme being secured on a data processing system. Such a method comprises a data structure stored in the computer-readable storage medium, the data structure including information readident in a database used by the application programme and including records, each record comprising information identifying a polymorphism shown in the above sequences. The application programme and including records, each record comprising information identifying a polymorphism shown in the above sequences. The products and methods can be used for the presence of a disease phenotype or in formatics, paternity testing or genetic mapping of phenotypic traits. They can also be used for the production of transgenic animals. The nucleic acid segments can also be used in the manufacture of medicaments for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequence that encodes an enzymatically active BLM protein. This is used in the Single-Strand Conformation Polymorphism (SSCP) Analysis of the BLM gene. SSCP analysis helps in identifying the mutants in the BLM gene. Bloom's syndrome is diagnosed by detecting 2 mutated BLM genes or the absence of a wild-type BLM gene in a subject. Delivery of a functional BLM gene to bone marrow cells is used to treat or prevent the onset of Bloom's syndrome. Identification of the BLM gene and its products should assist in the development of therapeutic and diagnostic agents for cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Diagnosing Bloom's syndrome, and carriers, by detecting mutant BLM genes - for gene therapy with nucleic acid encoding active BLM protein to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Fungus; yeast; tetracyclin; promoter; GRACE strain; biosynthesis;

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by the selectable marker and modifying other allele by the combination, of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles modified are useful for identifying a gene that is sesential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the compound catabolism, biosynthetic, transporter transcriptional, compound catabolism, biosynthetic, transporter transcriptional, compound is useful for identifying a compound having the ability to inhibit growth or proliferation of cativity to inhibit growth or proliferation of cataboner each that of a primer used in the method of the invention. Note: The sequence is that of a primer used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis, antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptemer; HBV reverse transcriptase; Enhancer I region; viral replication;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, include antisense care nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV CONA. The nucleic acids may be used to modulate the expression of HBV canson and/or potential therapies directed against HBV, and compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV ribozyme, inozyme, inozyme, zinzyme, DNAzyme or amberzyme sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
degenerative, disease state, HBV infection, HCV infection, cirrhosis, liver failure, hepatocellular carcinoma, hepatotropic, cytostatic, virucide, antiinflammatory, substrate, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ä

Hepatitis B virus.

WO200281494-A1.

17-OCT-2002.

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNazymes, inczymes, anozymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds, and/or potential therapies directed against HBV, and compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular cardinoma. The present sequence represents a substrate for one of the HBV ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences disclosed in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 17 BP; 5 A; 3 C; 3 G; 0 T; 6 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 1; Page 152; 387pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    infection.

```
The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

CC Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation to a DNA library, or monitoring gene expression levels by hybridisation to a DNA library, of at least one target sequence. The method of analysis comprises for incleic acid probes are specifically designed for analysis of at least one or more nucleic acids to at least two or more nucleic acids at least one or more nucleic acids to a least two or more content or a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, confamily members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises tag sequence. The array of nucleic acid further comprises of the sequence or specific or mutations of any gene, in mapping the 5' termini of mRNA molecules by containing segments of DNA that have been containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the concleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly compared in the microarray. Note: The sequence or sequence or sequence.
                                                                                                                                                                                                                                                        New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                              Claim 1; SEQ ID NO 60526; 9pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Duplex DNA (AAQ21864) (adapted from the L1 region of Human papilloma virus type 16) was used as a target to study the linear pre-amplification process. A probe set (QQ21865-8) was designed to hybridise to the target sequence for use in pre-amplification. The 3' end of probe 179.3 was haptenated with biotin-aminocaproyl NHS active ester. See also

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis compounds. The nucleic acid probes are specifically designed for analysis of genetic variation or in hybridisation. The nucleic acid probes are addence. The method of analysis comprises for hybridisating at least one or more nucleic acids to at least two or more nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the concleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotunelic acids further comprises a tag sequence or specific contactions of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening ONNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence and previously sequenced. The sequence presented is necessary from uncleic acid probes incorporated in the microarray. Note: The sequence and previously sequence or probe in sequence or specific for additional subclones containing segments of Note: The sequence or specific seconds for this patent can also be obtained in electronic format directly from used the nucleic acid probes incorporated in the sequence or specific seconds for this patent can also be obtained to the sequence or specific 
                                                                                                                                                                                                                                                                                                                                                                                                                         New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1; SEQ ID NO 1523; 9pp; English.

complementary to particular genes, and can be used as probes for a variety of analyses such as gene expression analysis. Each probe comprises 9 or more consecutive nucleotides from at least one of 14936 nucleotide sequences defined in the patent, or their perfect sense match, antisense match or antisense mismatch oligonucleotides. The probes may be used in an array comprising at least 10 distinct nucleic acid probes. The array is useful in monitoring gene expression levels by hybridisation to a DNA library, in analysing genetic useful in in situ hybridisations of a gene. The probes are also useful in in situ hybridisations, in screening cDNA or genomic libraries (or derived subclones) for additional clones containing segments of DNA that have been previously isolated and sequenced, in Southern, northern, or dot-blot hybridisation of genomic DNA to identify or detect the sequence of any gene or detect specific mutations in any gene, and in mapping the 5' termin of mRNA molecules by primer extensions. The invention provides a large collection of nucleic acid sequences of the invention are also useful as PCR primers. The invention provides a large collection of nucleic acid sequences complementary to particular genes with a wide range of analytical uses. The sequence of the invention provides a large collection of nucleic acid sequences of Achsologica Achsologica and the invention provides a large collection of nucleic acid sequences.

New probe array useful e.g. for monitoring gene expression levels, for analyzing genetic variations, or for hybridizing tag-labeled compounds, comprises multiple nucleic acid probes.

The sequence represents a primer used to sequence nucleic acids encoding cat Beta-amyrin synthase (an oxidosqualene cyclase). Beta-amyrin is a cut interponding tresponsible for paltability to animals and resistance to pathogens and predators. The beta-amyrin synthase encoding nucleic acid is useful for producing a transgenic plant, by introducing a vector containing into a host cell, optionally causing or allowing crecombination between the vector and the host cell genome so as to transform the host cell, and regenerating a plant from the transformed creaming the presence of a nucleic acid in a sample and for influencing or affecting the quantity or quality of triterpenoid creaming the presence of a nucleic acid in a sample and for influencing or affecting the quantity or quality of triterpenoid creaming the presence of a nucleic acid in a sample and for influencing or altering resistance to a fungal pathogen e.g., an claim as altering resistance to a fungal pathogen e.g., an cascomycete having a sterol-containing membrane, optionally selected from ascomycete having a sterol-containing membrane, optionally selected from cascomycete having of the plant, by causing or allowing expression of the nutritional value, of the plant, following or allowing expression of the introducing the DNA into a cell or its ancestor. The DNA is also useful containing transcription from an antisense molecule in the plant, allowing transcription from an antisense molecule in the plant, allowing error allowing expression of the pracery of allowing transcription from an antisense molecule in the plant, allowing expression of the pracery of allowing transcription from an antisense molecule in the plant, allowing error e
                                                                                                                                                                                                                                                                                                                                                                                                                 Novel beta-amyrin synthase encoding nucleic acids useful for influencing or affecting triterpene synthesis, and hence resistance to fungal pathogen, taste, palatability or nutritional value of plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                transcription from the DNA, or its part such as to reduce beta-amyrin synthase expression by co-suppression, use of a nucleic acid encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Effector checkpoint protein kinase; Chk1; hyperproliferation; HIV; cancer; cytostatic; anti HIV; gene therapy; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAF83283
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to mutatic acts asymptomes that are comprises such as gene expression analysis. Each probe comprises you more consecutive nuclectides from at least one of 14936 nucleotide sequences defined in the patent, or their perfect sense match, comprises you more consecutive nucleotides enjoyed in a maray comprising at least to distinct.

The probes may be used in an array comprising at least to distinct nucleic acid probes. The array is useful in monitoring gene expression nucleic acid probes. The array is useful in monitoring gene expression caseful for identifying family members of a gene. The probes are also useful in in situ hybridisations, in screening compounds. The probes are useful in in situ hybridisations, in screening compounds are also useful in in situ hybridisations, in screening containing segments of that have been previously isolated and sequenced, in Southern, northern, or dot-blot hybridisation of genomic Danes containing nay gene, and in may gene or detect specific mutations in any gene, and in captured and sequenced in symmetry to particular specific mutations in any gene, and in mapping the 5' termini of mrnA molecules by primer extensions. The complementary to particular sense with a wide range of analytical uses.

The invention provides a large collection of nucleic acid sequences of the invention are also useful as PCR primers. The sequence data for this patent was obtained in electronic format complemented and for this patent was obtained in electronic format the carget at sequences of the invention. Note:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New probe array useful e.g. for monitoring gene expression levels, for analyzing genetic variations, or for hybridizing tag-labeled compounds, comprises multiple nucleic acid probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              present invention relates to nucleic acid sequences that are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               64.0%; Score 12.8; DB 8; Length 25; 87.5%; Pred.                                                                                                                                                                                                          The invention relates to an isolated, soluble, catalytically active human effector checkpoint protein kinase (Chk1) polypeptide. Chk1 protein can be expressed by standard recombinant methodology. Chk1 is useful for screening for its inhibitors, used for treating hyperproliferative diseases, such as, HIV and cancer. The Chk1 DNA is useful for probes, primers, chemical intermediates, and in biological assays. Sequences AAF83283-290 represent PCR primers for amplifying the human Chk1 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of
                                                                                                                                            Novel isolated, soluble, catalytically active human effector checkpoint protein kinase, useful for screening inhibitors of hChk1 kinase, for treating hyperproliferative disorders such as HIV and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            88.

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertion or replacement fragment with a heterologous promoter, so that expression of the sacond allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that cells in which both alleles modified are useful for identifying a gene that cells in which both alleles of a gene are modified. The diploid fungal contributes to the survival or growth of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus agent, an antifungal agent that inhibits the growth of a diploid fungus of and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the compound catabolism, biosynthetic, transporter, transcriptional, compound catabolism, signal transduction, DNA replication and cell division attivity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of a PCR construction into method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           genomic map; haplotype; phenotype; polymorphic base; genotyping;

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the diffications responses to and side effects from the actually acting on a disease as well as other treatment. New avian paramyxovirus cDNA, useful for production of vaccine against disease virus Newcastle

Disclosure; Page 33; 115pp; English.

This invention describes a novel avian-paramyxovirus cDNA (I) which comprises a nucleic acid sequence corresponding to the 5' terminal end of the genome of avian-paramyxovirus allowing the generation of an infectious copy of avian-paramyxovirus. The cell line is useful for the production of infectious lentogenic NDV (Newcastle Disease virus) without the addition of exogenous proteolytic activity. Also it is possible to generate a stable transfected cell line that expresses the wild-type F protein in the virus envelope therefore providing infectious particles, useful in the form of a vaccine, especially against respiratory and/or

analysis of S. cerevisiae YOL077C knock-out mutant

The invention relates to genes in S. cerevisiae which are essential for germination and proliferation. The essential genes (EG) such as YDR141C, YDR091C, YOLOSCG, YOLOSAW and YOLO77C are used in a method for identifying potential antifungal compounds (CP). The method comprises overexpressing the EG cells, isolating a subset of genes induced of repressed by overexpression of EG and determining effect of Cp on down/up regulation of any subset of genes or contacting a protein encoded by EG with Cp and determining binding between them. Cp is identified as a potential antifungal Cp, if it downregulates a gene that is induced by coverxpression of EG or if it upregulates the gene that is repressed by coverxpression of EG or if it upregulates the protein encoded by coverage useful for identifying novel antifungal compounds for the method is useful for identifying novel antifungal compounds for treating fungal diseases and proliferative discorders in humans and nonthum mammals, including monkeys and other primates, dogs, cats.

Sequences AAFB23273-280 represents PCR primers for the construction and
gastrointestinal diseases. NDV can be easily cultured to very high titers in embryonated eggs. Mass culture of embryonated eggs is relatively cheap. NDV vaccines are relatively stable and can be simply administered by mass application methods e.g. drinking water or by spraying or by aerosol formation. The natural route of infection is by the respiratory and/or gastrointestinal fract which are also the major routes of infection of many other poultry pathogens. NDV can induce local immunity despite the presence of circulating maternal antibody. AAZ44527-Z44609

This sequence represents an example of the first probe used for genotyping Mycobacterium species. The array is useful for simultaneously genotyping Mycobacterium species, differentiating M. tuberculosis strains and detecting antibiotic-resistant strains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô

cc acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. CC perfect match perfect mismatch, antisense match or antisense mismatch. CC also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, cc in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. Each of the comprises in levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in is stu hybridisation, in Southern, Northern or dotuprobes is useful in in situ hybridisation, in Southern, Northern or dotuprobes is useful in in stu hybridisation, sequence or specific or mutations of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones or inclair and problems of the sequence presented is one of the nucleic acid problems increment the sequence presented is one of the nucleic acid transfer in the sequence or presented is one of the sequence presented is one of the nucleic acid transfer in the problems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at sequata.uspto.goc/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes the isolation of a novel Staphylococcus aureus ATPase subunit of preprotein translocase (SecA). SecA polypeptides and polymerotein translocase (SecA). SecA polypeptides and underexpression of SecA protein by identifying mutations in the SecA gene, or determining SecA polypeptide or mRNA expression levels due to an infection of an organism with the SecA gene. They can diagnose the stage infection of an organism with the SecA gene. They can diagnose the stage and type of infection. SecA polypeptides can be used in treatment to inhibit (antagonist i.e. antibacterial drugs) or enhance (agonist) SecA crivity. Diseases diagnosed, prevented or treated include bacterial infections, especially Staphylococcus aureus infections of the upper and lower respiratory tract (e.g. ottiss media, thyroiditis), cardiac (e.g. infective endocarditis), gastrointestinal (e.g. secretory diarrhoea, splenic abscess), CNS (e.g. crebral abscess), eye (e.g. conjunctivitis, keratitis, widney and urinary tract (e.g. toxic shock syndrome), skin (e.g. imperigo, wound infection), and bone and joint (e.g. septic arthritis, osteomyelitis). SecA polypeptides, polynucleotides and their (ant) agonists can prevent adhesion of bacteria to prevent bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New Staphylococcus aureus ATPase subunit of preprotein translocase (SecA2) polypeptide and polynucleotide - useful as diagnostic reagents and for prevention and treatment of Staphylococcus aureus infections, including toxic shock syndrome and splenic abscess.
                                                                                                                                                                                                                                                treatment; inhibit; antagonist; agonist; disease; bacterial; cardiac; respiratory tract; gastrointestinal; central nervous system; CNS; eye; kidney; urinary tract; skin; bone; joint; bacterial adhesion; wound; matrix proteins; body implant; PCR primer; ss.

Human microarray DNA oligonucleotide SEQ ID NO 36372.

```
The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis. The array is used in analysis. The array is used in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparises, acid the conclet acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific conclets as useful in in situ hybridisation, in Southern, Northern or dottores is useful in in situ hybridisation, in Southern, Northern or dottores are attached to a solid suppond the 5' termini of many molecules by compared to a solid suppond the 5' termini of many molecules by compared to a solid suppond the 5' termini of many molecules by compared to a solid suppond the 5' termini of many and the sequence or specific.

The follow of the sequence or specific acid for additional subclones containing segments of but that have been the sequence or specific acid for additional subclones containing segments of but that have been sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly from USPTO at seqdata.uspto.goc/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                          EST; ss; probe; expressed sequence tag; microarray; gene expression; genetic variation; biallelic marker; polymorphism; human; cross-species comparison.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 36372; 9pp; English.

```
The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises of the probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring confamily members of a gene and a cross-species comparison. Each of the nucleic acids further comprises species comparison. Each of the concleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence or specific or probes is useful in in situ hybridisation, in Southern, Northern or dotuposes is useful in in situ hybridisation, in Southern, Northern or dotuposes is useful in in situ hybridisation, in Southern, Northern or dotupose primer extensions or in screening cDNA or genomic libraries or subclones cortain subclones containing segments of DNA that have been conformed and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence of the nucleic acid probes incorporated in the microarray. Note: The sequence of the mucleic acid probes incorporated in the sequence presented is one of the conditional sequence or sequence presented is one of the sequence or securing or sequence or sequence or sequence or sequence or sequen

```
The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch.

Compounds a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dotblot hybridisation to identify or detect the sequence or specific additional subclones containing segments of DNA that have been to prime extensions of any gene, in mapping the 5' termin of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been contained and previously sequenced. The sequence date for this patent can also be obtained in electronic format directly from USPTO at sequence thum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring can expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid further comprises a tag sequence. The array of nucleic acid by hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termin of mRNA molecules by primer extensions or in screening DNA or genomic libraries or subclones for additional subclones containing segments of bush that have been isolated and previously sequenced. The sequence presented is one of the

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its component match, perfect match, perfect mismatch, antisense match or antisense mismatch.

CC Also disclosed is a method of gene expression analysis. The array is used in analysis of genetic variation or in hybridisation to a DNA library, cC in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises comparises and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acids further comprises a tag sequence. The array of nucleic acid content of dentify or detect the sequence or specific or nucleic acids further or identify or detect the sequence or specific or probes is useful in in situ hybridisation, in Southern, Northern or detect the additional subclones containing segments of DNA that have been contained and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence or appendence or an also be obtained in electronic format directly from treath or an also be obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                         New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 25 BP; 7 A; 3 C; 5 G; 10 T; 0 U; 0 Other;

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its C acid probes including one of 2,018,500 fully defined sequences, or its C Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises hybridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, cor family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dottor hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' terminal of mRNA molecules by comparisons of any gene, in mapping the 5' terminal of DNA that have been containing segments of DNA that have been sololated and previously sequenced. The sequence presented is one of the concleic acid probes incorporated in the microarray. Note: The sequence containing sequence the sequence and probes incorporated in the microarray. Note: The sequence of the form USPPO at sequence of the concleic acid probes incorporated in the microarray. The sequence

```
The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in manlysis of genetic variation or in hybridisation to a DNA library, compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one target sequence. The method of analysis comprises in hybridising at least one or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tay sequence. The array of nucleic acid further comprises a tay sequence. The array of nucleic acid further comprises a tay sequence. The array of nucleic acid further comprises a tay sequence. The array of nucleic acid for any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening cDNA or genomic libraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the form of t
                                                                                                                                                                                                                                                                                                                                                                                   New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 25 BP; 11 A; 6 C; 4 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            from USPTO at seqdata.uspto.goc/sequence.html

The invention discloses a microarray comprising a plurality of nucleic acid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises of at least one or more nucleic acid probes and at least two or more nucleic acid probes and acted to a solid support. The analysis comprises monitoring probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of agene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern, Northern or dot-probes is useful in in situ hybridisation, in Southern, Northern or dot-probes is useful in a mapping the 5' termin of many molecules by prime expressions or in screening conk or genenic of any gene, in mapping the 5' termin of many have been a party for the companies of my have been any accounted to the companies of my have been any accounted to the companies of my have been any sone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          for this patent can also be obtained in electronic format directly
                                                                                                                                                                                                                                                                                   New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              from USPTO at segdata.uspto.goc/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1; SEQ ID NO 35597; 9pp; English.

                                                                                                                                                                                                                                          mapped to human chromosome 11p. ASTHII and ASTHIIJ are genes present within the locus, located close to each other on human chromosome 11p, and have similar patterns of expression, and common sequence motifs. The ASTHI genes and fragments, encoded protein, genomic regulatory regions and anti-ASTHI antibodies are useful in the identification of individuals predisposed to development of asthma, and for the modulation of gene activity in vivo for prophylactic and therapeutic purposes. The ASTHI protein is useful as an immunogen to raise specific antibodies, in drug screening for compositions that mimic or modulate ASTHI activity or expression, including altered forms of ASTHI protein, and as a therapeutic. Sequences AAZI8510-2186311 represent PCR primers for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ASTH1 polymorphic microsatellite marker AFMA154ZD1 primer, SEQ ID NO:223.
                                                                                                                                              Mammalian asthma related genes, useful for diagnosis of a predisposition to development of asthma.
                                                                                                                                                                                                                            The invention identifies a genetic locus ASTH1, associated with asthma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to the ASTH1 locus on the short arm of human chromosome (11p). This locus comprises the ASTH1 and ASTH1J genes, which chromosome (11p). This locus comprises the ASTH1I and ASTH1J genes are oriented in opposite of APTH conditions with the ASTH1 and ASTH1J are novel members of expression and common sequence motifs. They are both expressed in trached, lung and common sequence motifs. They are both expressed in trached, lung and common sequence motifs. They are both expressed in trached, lung and common sequence motifs. They are both expressed in trached, lung and common sequence motifs. They are both expressed in trached, transcription factors, which have been implicated in the common sequence motifs. They are both expressed in trached, attentively spliced. Alternative splicing of ASTH1 mans a no effect on the open reading frame of ASTH1J and ASTH1I mans an offect on the open reading frame of ASTH1J and alternative splicing of ASTH1I transcripts results in 3 different ASTH1I inscripts a precision of a stanscripts are useful as dagnostics to identifying ASTH1 related genes, for identifying expression of the gene in a biological specimen, and for generating geneticinally modified non-human animals or site specific gene (modifications that mimic or modulate activity or expression of ASTH1I compositions that mimic or modulate activity or expression of ASTH1I compositions that mimic or modulate activity or expression of ASTH1I compositions that mimic or modulate activity or expression of ASTH1I compositions that mimic or modulate activity or expression of ASTH1I compositions that mimic or modulate activity or expression of ASTH1I compositions that mimic or modulate activity or expression of ASTH1I compositions that mimic or modulate activity or expression of ASTH1I and as a theorem of activity in vivo for compositions that mimic or modulate activity or expression of ASTH1I and a therapeutic purposes the intract ASTH1I and a therapeutic purposes the intract ASTH1I and therapeutic purposes the intra
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
               New nucleic acids other than naturally occurring chromosomes encoding ASTH1 protein, for e.g. screening compositions that modulate expression or function of ASTH1 proteins or as diagnostics for genetic predisposition to asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              immunomodulator; cytostatic; nootropic; neuroprotective;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to novel human NOV proteins and their coding sequences (ACC72075-ACC72181 and ABRS8863-ABRS8465). The NOV proteins are useful in manufacturing a medicament for treating a syndrome associated with a human disease. The NOV proteins and coding sequences may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoletic disorders and various dyslipidaemias. The present sequence is a PCR primer, used in an example from the invention

                        CDNA sequence AAQ37477, encoding a neutrotrophic factor (NF), was derived from the native ciliary neurotrophic factor (CNTF) (e.g. EP-385060) by PCR amplification. In order to obtain a DNA sequence encoding the NF(1-180), a portion of the DNA sequence encoding AAB 76-180 of full-length CNTF was amplified using PCR from a bacterial expression vector, plasmid pSP18 and synthetic PCR primers AAQ37473 and AAQ37474. (Updated on 25-MAR-2003 to correct PN field.)

This invention relates to novel isolated aptamers comprising at least one base capable of base pairing and different from the standard Watson-Crick (W-C) bases. The invention also comprises a method for sequencing nucleic acids. The aptomers of the invention are useful for isolating a specific cids. The aptomers of the invention are useful for isolating a specific aptamer, mixing it with a pool of ligands, and recovering the specific aptamer. The aptomers of the invention are useful for detection of specific ligand from a biological sample, by selecting at least one specific aptamer, capable of binding to a specific selecting at least one specific aptamer with a biological sample, mixing the at least one specific one aptamer, and detecting the presence and/or quantity of the specific ligand from the biological sample bound to at least one aptamer. The aptamer of the invention is useful as a drug and for therspeutic treatment. The present sequence represents a 50 bp spacer oligonucleotide used in the construction of an aptamer of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
New aptamer comprising one base capable of base pairing and different from the standard Watson-Crick base, useful for isolating a specific ligand from a pool of ligands.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 12.6; DB 6; Length 50;

Woodward R, Quertermous T, Johnson F;

New system for leukocyte expression profiling, diagnosing a disease, or

The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligomucleotides (ABZ00010-ABZ00315) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for

New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.

                                                                          The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         T7; leukocyte; gene expression profiling; allograft rejection; atherosclerosis; congestive heart failure; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; cytomegalovirus; infection; probe;

for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting thesese complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, rishes allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis or cytomegalovirus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fungus; yeast; tetracyclin; promoter; GRACE strain; biosynthesis; signal transduction; DNA replication; cell division; growth; proliferation; Candida albicans; fungicide; antifungal; PCR; primer; ss.

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying con allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertion, of a promoter replacement fragment with a heterologous recombination, of a promoter replacement fragment with a heterologous promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that cells in which both alleles modified are useful for identifying a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon

                translational, signal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of a PCR primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 58587, Application US/10027632
Publication No. US20020198371A1
GENERAL INFORMATION:
APPLICANT: Wang, David G.
TITLE OF INVENTION: Identification and Mapping of Single Nucleotide
TITLE OF INVENTION: Polymorphisms in the Human Genome
FILE REFERENCE: 108827.128
CURRENT APPLICATION NUMBER: US/10/027,632
CURRENT FILING DATE: 2002-04-30
PRIOR APPLICATION NUMBER: US 60/218,006
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ; OTHER INFORMATION: Description of Artificial Segeunce: PCR primer US-10-353-274-3

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 49,

US-09-187-050-9
US-09-187-050-9
Sequence 9, Application US/09187050B
Patent No. 6043072
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: Nucleic Acids Encoding Taxus Geranylgeranyl Diphosphate
TITLE OF INVENTION: Synthase, And Methods of Use
FILE REFERENCE: WSUR12423
CURRENT APPLICATION UNDER: US/09/187,050B
CURRENT FILING DATE: 1998-11-05
NUMBER OF SEQ ID NOS: 34
SOFTWARE: PatentIn Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                OTHER INFORMATION: Description of Artificial Sequence: PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NAME/KEY: misc_difference
LOCATION: (1)...(43)

Sequence 11, Application US/09086726

Patent No. 6346378

GENERAL INFORMATION:

APPLICANT: Stanley, Christopher John
APPLICANT: Oruw, Henrik
APPLICANT: Oruw, Henrik

TITLE OF INVENTION: Nucleic Acid Analogs With A Chelating Functionality
FILE REFERENCE: 108382-08046

CURRENT APPLICATION NUMBER: US/09/086,726

CURRENT FILING DATE: 1996-05-24

PRIOR FILING DATE: 1996-05-24

PRIOR FILING DATE: 1994-11.22

PRIOR FILING DATE: 1994-11.25

NUMBER OF SEQ ID NOS: 11

SOUTWARE: PatentIn version 3.1

LENGTH: 37

US-09-270-140A-52

i Sequence 52, Application US/09270140A

j Patent No. 6361941

i GENERAL INFORMATION:
i APPLICANT: Toda, Alison
i APPLICANT: Toda, Alison
i APPLICANT: Todaris, Murray
i TITLE OF INVENTION: Catalytic Nucleic Acid base Diagnostic Methods
i TITLE OF INVENTION: Catalytic Nucleic Acid base Diagnostic Methods
i CURRENT APPLICATION NUMBER: US/09/270,140A
i CURRENT FILING DATE: 1999-03-16
i PRIOR FILING DATE: 1998-03-27
i NUMBER OF SEQ ID NOS: 96
i SOFTWARE: PatentIn Ver. 2.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                   ADDRESSEE: Mueting, Raasch, Gebhardt & Schwappach, P.A.

I Sequence 847, Application US/09443199C

FREAD INFORMATION:
GENERAL INFORMATION:
FRIENCEMAT:
APPLICANT: Shimkets, Richard A.
TITLE OF INVENTION: Nucleic Acids Containing Single Nucleotide
TITLE OF INVENTION: Polymorphisms and Methods of Use Thereof
FILE REFERENCE: 15966-534A
CURRENT APPLICATION NUMBER: US/09/443,199C

CURRENT APPLICATION NUMBER: 60,109,024

FRICH FILING DATE: 1998-11-17

NUMBER OF SEQ ID NOS: 1272

SOFTWARE: CuraGen Patent Formatter Version 0.9

SEQ ID NO 847

LENGTH: 51
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .;

TITLE OF INVENTION: Staphylococcus aureus Polymucleotides and Sequences

NUMBER OF SEQUENCES: 5256

CORRESPONDENCE ADDRESS:

ADDRESSEE: Human Genome Sciences, Inc.

STREET: 9410 Key West Avenue

CITY: Rockville

STATE: Maryland

COUNTRY: USA
                                                                         APPLICANT: Barany, Francis
APPLICANT: Lubin, Matthew
TITLE OF INVENTION: DETECTION OF NUCLEIC ACID SEQUENCE DIFFERENCES USING
TITLE OF INVENTION: COUPLED LIGASE DETECTION AND POLYMERASE CHAIN REACTIONS
FILE REFERENCE: 19603/441
CURRENT APPLICATION NUMBER: US/09/440,523
CURRENT PILING DATE: 1999-11-15
PRIOR FILING DATE: 1997-05-28
NUMBER OF SEQ ID NOS: 76
SOFTWARE: PATENTIN Ver. 2.0
SEQ ID NO 61

Reguence 399, Application US/09479005A
Retent No. 6656731
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: Nucleic Acid Catalysts with Endonuclease Activity
TITLE OF INVENTION: Nucleic Acid Catalysts with Endonuclease Activity
FILE REFERENCE: MBH800-884-C
CURRENT FILING DATE: 2000-01-07
RIOR APPLICATION NUMBER: US 09/444,209
PRIOR FILING DATE: 1999-11-19
PRIOR FILING DATE: 1999-11-19
PRIOR FILING DATE: 1999-12-2
us-uw-303-275-1999/c

Sequence 199, Application US/08303275

Patent No. 576658

GENERAL INFORMATION:
APPLICANT: Pacletti, Enzo
APPLICANT: Tarteglia, James
APPLICANT: Cox, William I.

TITLE OF INVENTION: IMMUNODEFICIENCY VIRUS RECOMBINANT
TITLE OF INVENTION: IMMUNODEFICIENCY VIRUS RECOMBINANT
TITLE OF INVENTION: POXVIRUS VACCINE
NUMBER OF SEQUENCES: 205
CORRESPONDENCE ADDRESS:
ADDRESSEE: Cutis, Morris & Safford
ADDRESSEE: Cutis, Morris & Safford
ADDRESSEE: Cow William S. Frommer
CITY: New York

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                   Sequence 57, Application US/08261822A
Patent No. 565053
GENERAL INFORMATION:
APPLICANT: Ecker, Joseph R. et al.
TITLE OF INVENTION: Plant Genes for Sensitivity to Ethylene
TITLE OF INVENTION: and Pathogens
NUMBER OF SEQUENCES: 82
CORRESPONDENCE ADDRESS:
ADDRESSEE: Woodcock, Washburn, Kurtz, Mackiewicz & No. 5650553ris
STREET: One Liberty Place, 46th floor
                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;
